EER to Relational Mapping

EER to Relation Mapping

- Mapping of superclass/subclass relationships
- Mapping of shared subclasses
- Mapping of union types (categories)

Mapping of Superclass/Subclasses

- Let R be the superclass
- $\{S_1, S_2, \dots, S_m\}$ are the subclasses
 - Each subclass can have its own local attributes

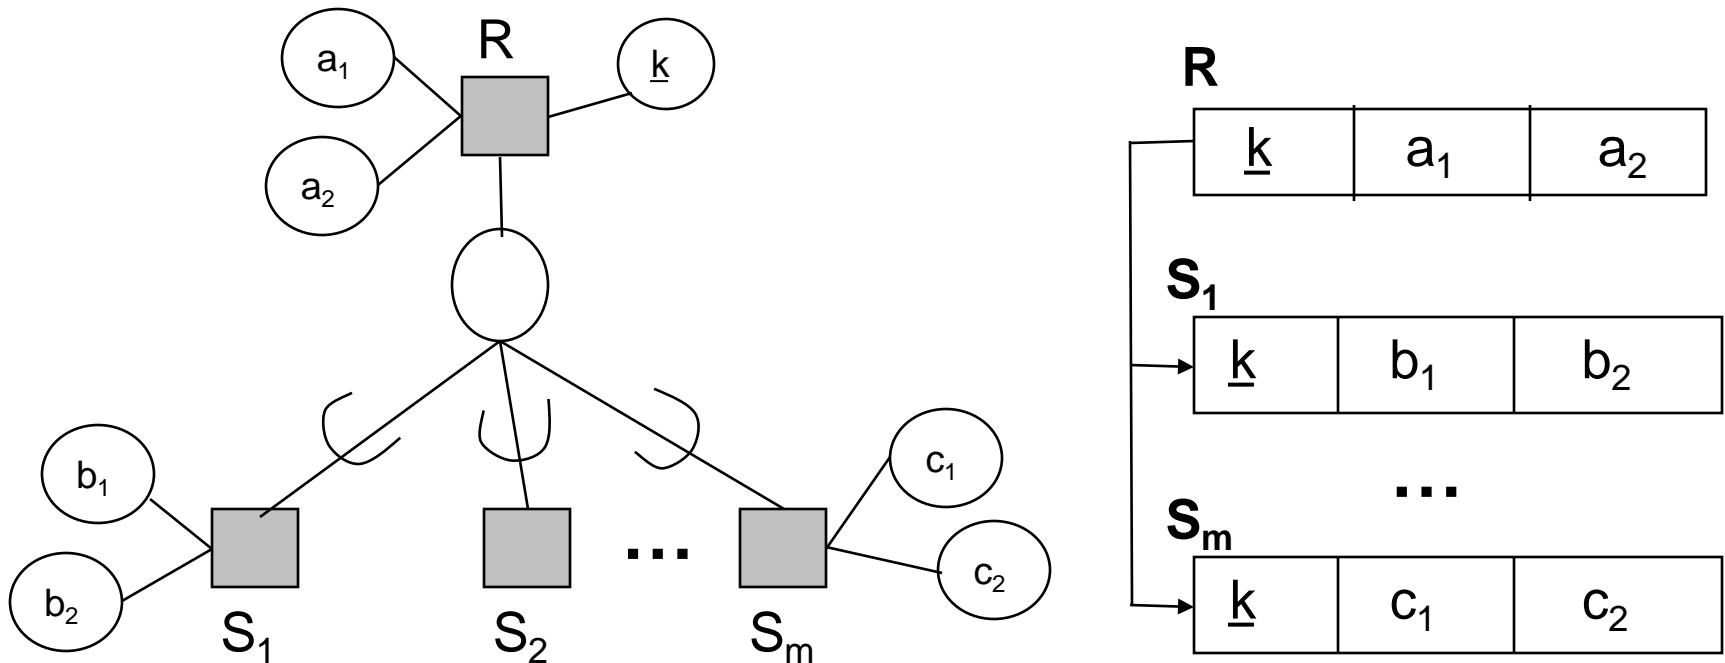

EER to Relation Mapping

Step 7: 4 possible approaches

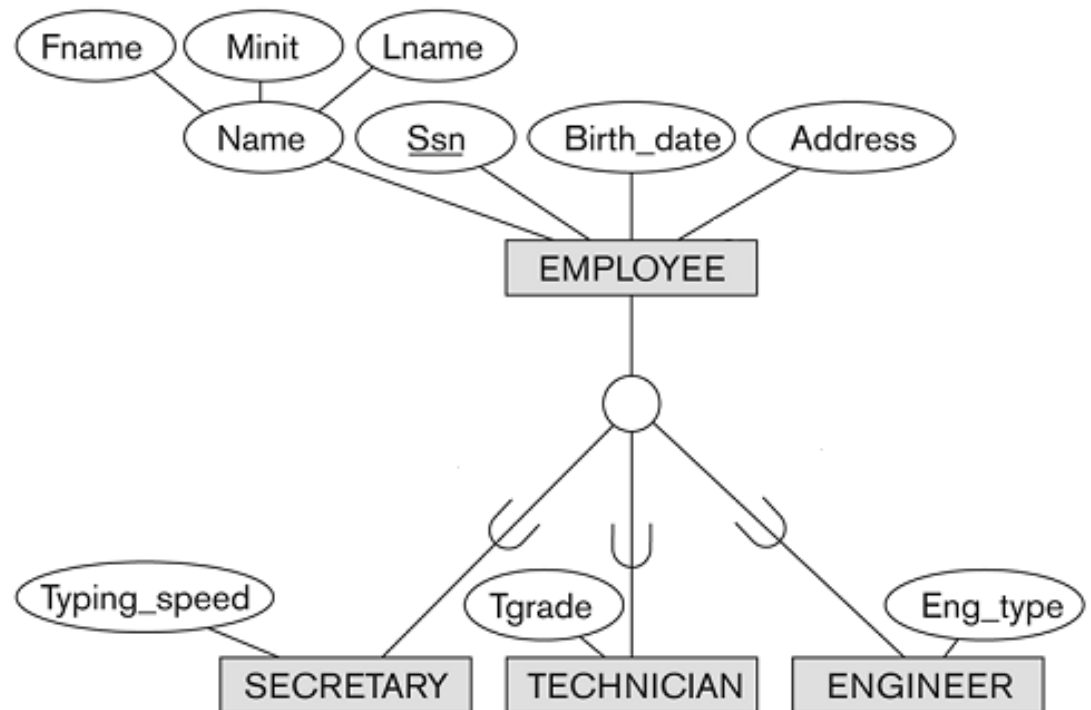

- Option 7A: Multiple relations – Superclass and subclasses
- Option 7B: Multiple relations – Subclass relations only
- Option 7C: Single relation with one type attribute
- Option 7D: Single relation with multiple type attributes

Mapping EER Constructs to Relations

- Option 7A: Multiple relations - superclass and subclass
 - Create superclass relation with attributes $\{k, a_1, a_2\}$ and primary key (PK) = k
 - Create a relation S_i for each subclass S_i , with attributes $\{k\} \cup \{\text{attributes of } S_i\}$ with PK = k .
 - This option works for any constraints: disjoint or overlapping; total or partial.

Example

EMPLOYEE

<u>SSN</u>	FName	Minit	LName	BirthDate	Address
------------	-------	-------	-------	-----------	---------

SECRETARY

<u>SSN</u>	TypingSpeed
------------	-------------

TECHNICIAN

<u>SSN</u>	TGrade
------------	--------

ENGINEER

<u>SSN</u>	EngType
------------	---------

Mapping EER Constructs to Relations

- Option 7B: Multiple relations –subclass relations only
 - Create a relation for each subclass S_i , with the attributes of S_i and the superclass
 - Works for **total specialization** (i.e., every entity in the superclass must belong to (at least) one of the subclasses)
 - If not total, entity not belonging to any sub-class is lost.

S_1

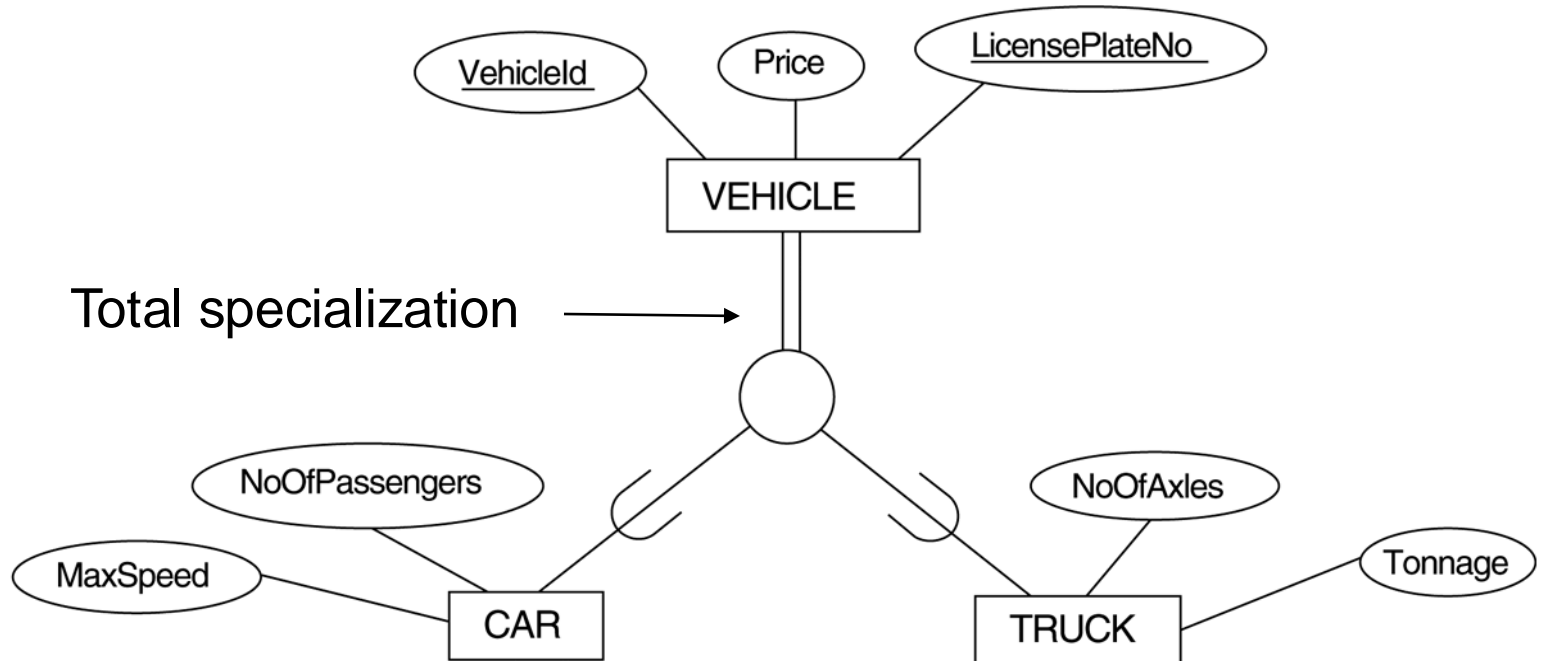

<u>k</u>	b_1	b_2	a_1	a_2
----------	-------	-------	-------	-------

...

S_m

<u>k</u>	c_1	c_2	a_1	a_2
----------	-------	-------	-------	-------

Example

CAR

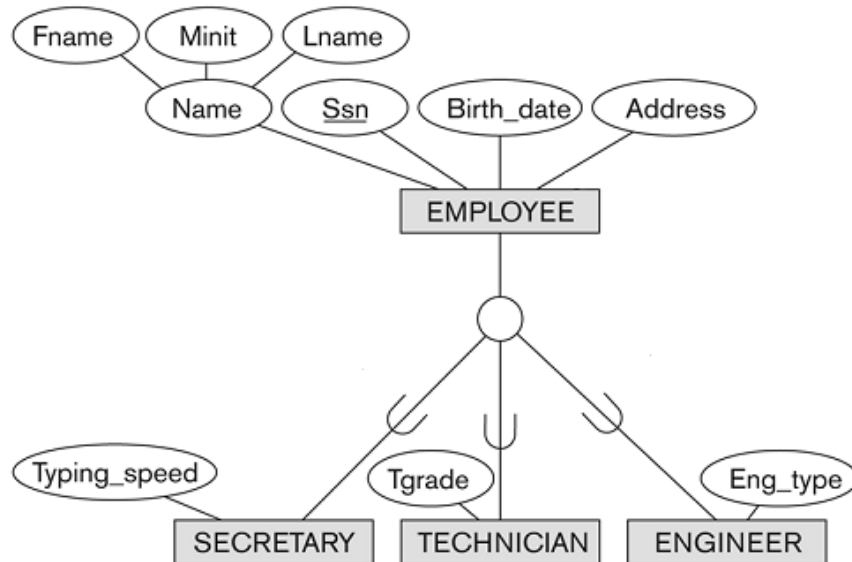

<u>VehicleId</u>	LicensePlateNo	Price	MaxSpeed	NoOfPassengers
------------------	----------------	-------	----------	----------------

TRUCK

<u>VehicleId</u>	LicensePlateNo	Price	NoOfAxles	Tonnage
------------------	----------------	-------	-----------	----------------

Limitation of previous two approaches

- Query: What does John Doe do as an employee?

To answer this query, we need to scan all three subclass relations, which is inefficient!

EMPLOYEE

<u>SSN</u>	FName	Minit	LName	BirthDate	Address
------------	-------	-------	-------	-----------	---------

SECRETARY

<u>SSN</u>	TypingSpeed
------------	-------------

TECHNICIAN

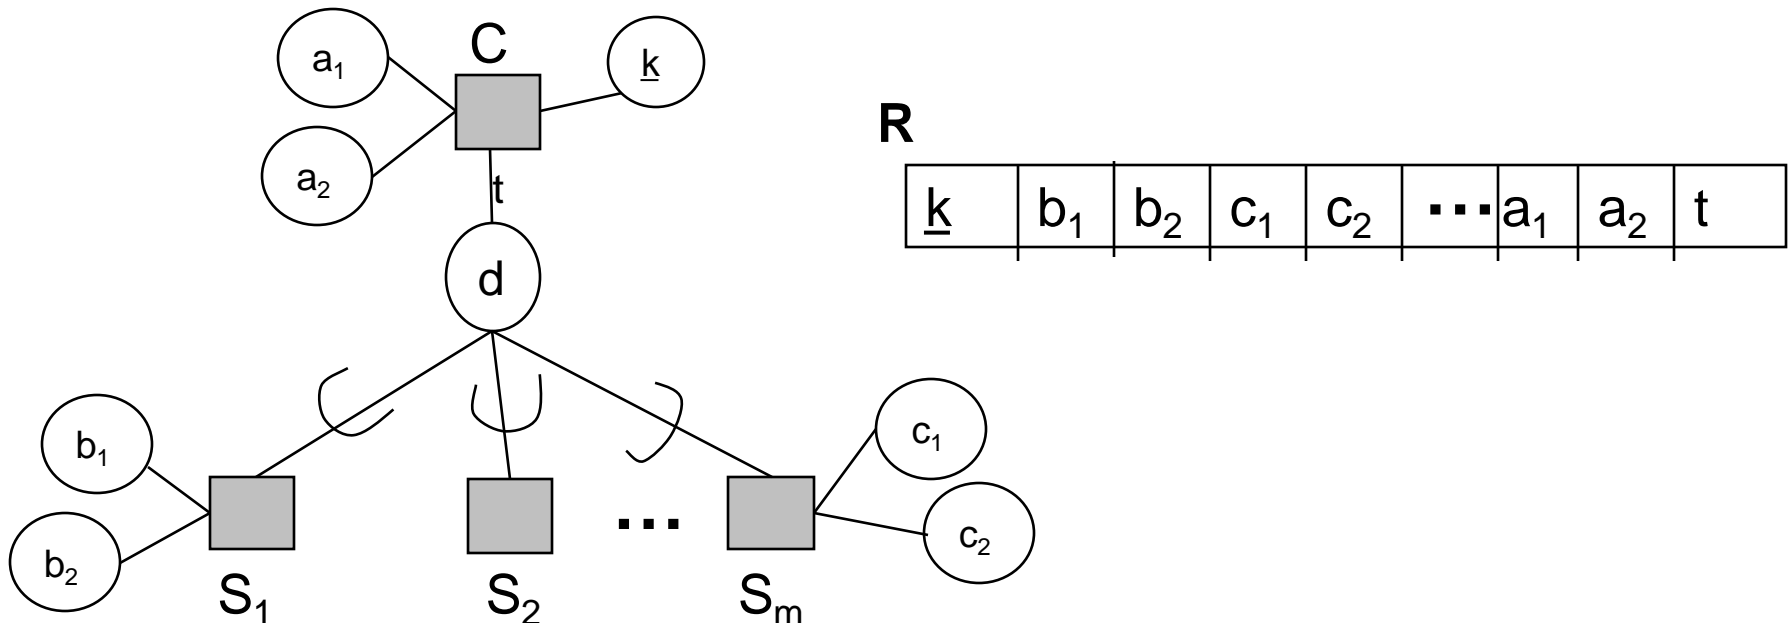

<u>SSN</u>	TGrade
------------	--------

ENGINEER

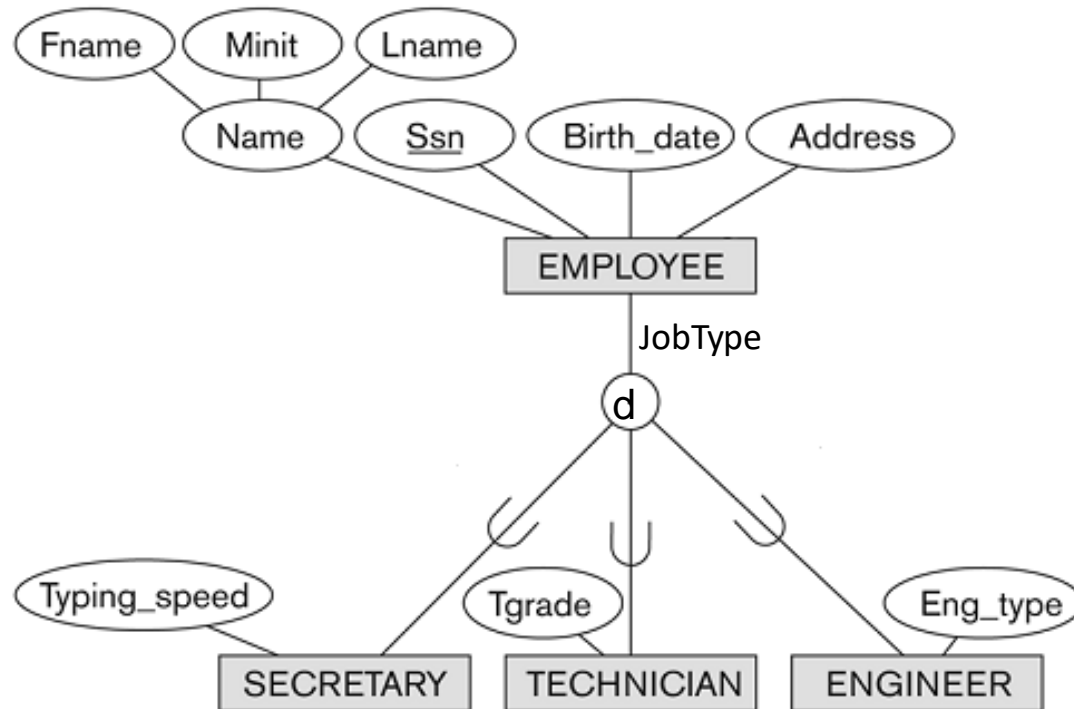

<u>SSN</u>	EngType
------------	---------

EER to Relations Mapping

- Option 7C: Single relation – with one type attribute (t)
 - Create a single relation with attributes $\{k, a_1, \dots, a_n\} \cup \{\text{attributes of } S_1\} \cup \dots \cup \{\text{attributes of } S_m\} \cup \{t\}$ with primary key, $PK = k$
 - The attribute t is called a type (or discriminating) attribute
 - This option works for **DISJOINT specialization**
 - This option may generate a large number of null values.

Example

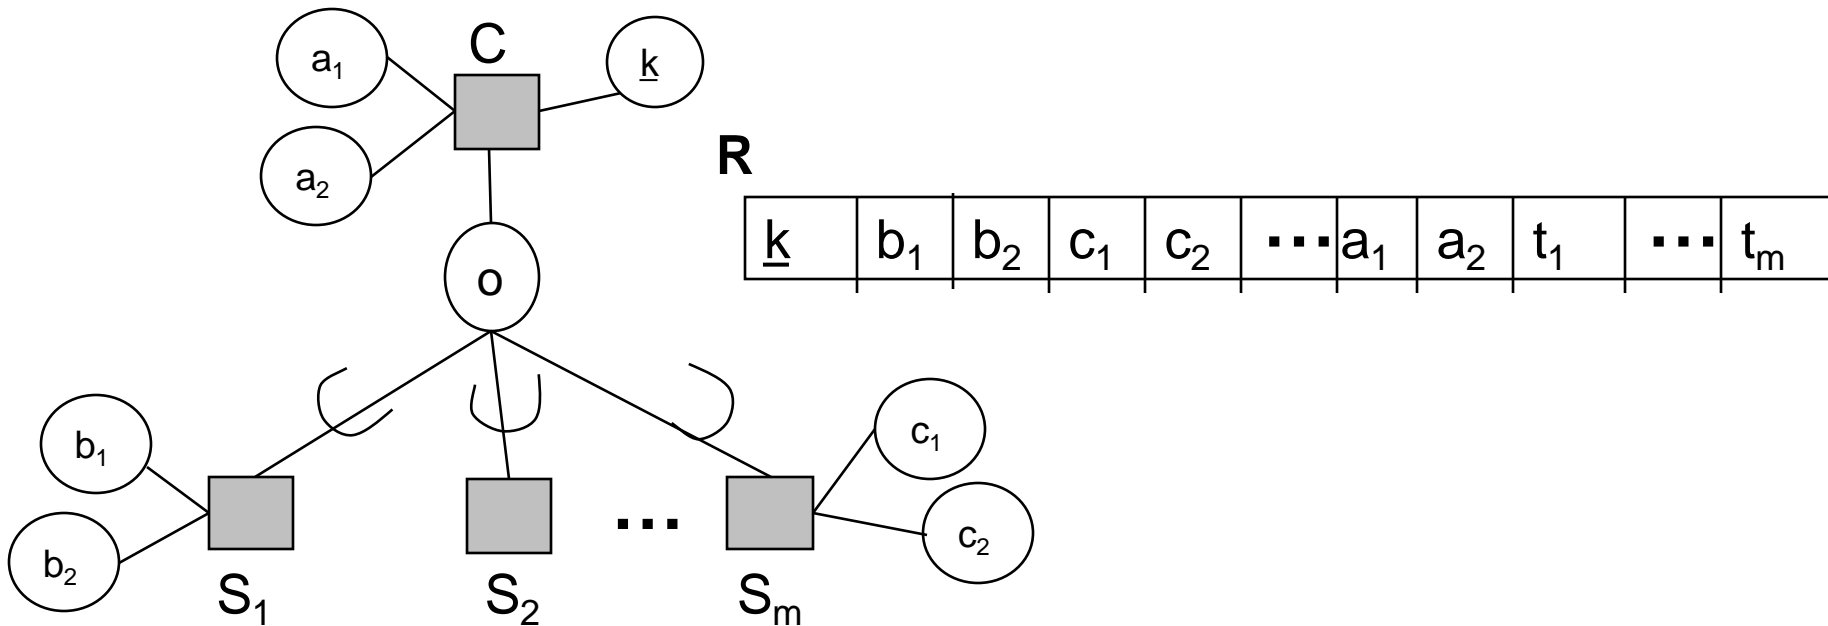

EMPLOYEE

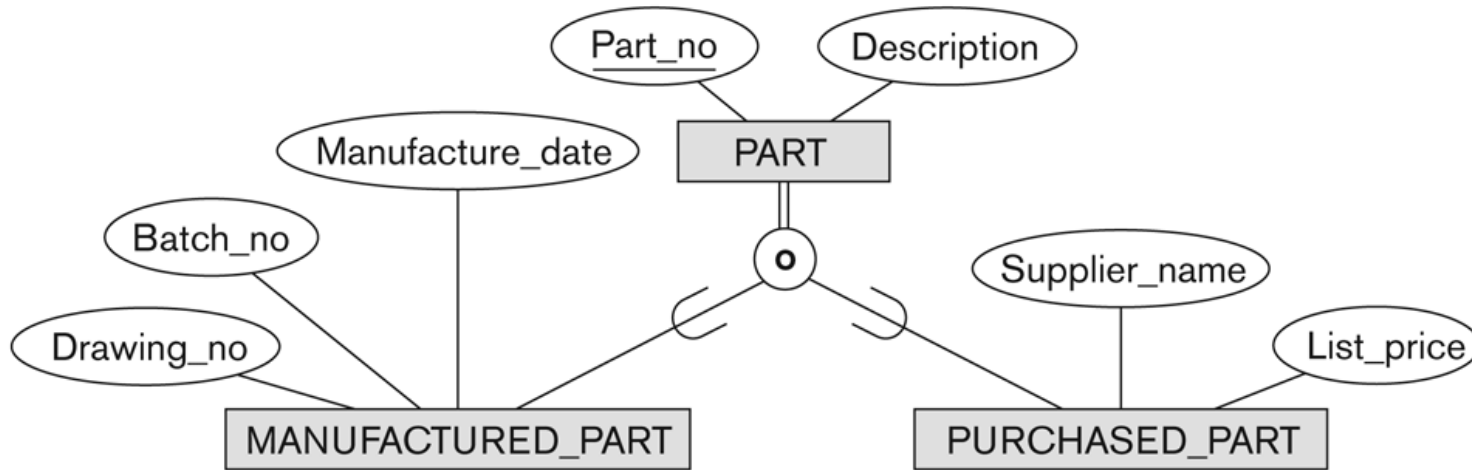

<u>SSN</u>	FName	MInit	LName	BirthDate	Address	JobType	TypingSpeed	TGrade	EngType
------------	-------	-------	-------	-----------	---------	---------	-------------	--------	----------------

EER to Relations Mapping

- Option 7D: Single relation – with multiple type attributes
 - Create a single relation with attributes $\{k, a_1, \dots, a_n\} \cup \{\text{attributes of } S_1\} \cup \dots \cup \{\text{attributes of } S_m\} \cup \{t_1, t_2, \dots, t_m\}$ and $PK = k$
 - t_i is a Boolean attribute indicating whether a tuple belongs to S_i .
 - This option works for **overlapping specialization**
 - This option is for specialization whose subclasses are overlapping

Example

PART

<u>PartNo</u>	Description	MFlag	DrawingNo	ManufactureDate	BatchNo	PFlag	SupplierName	ListPrice
---------------	-------------	-------	-----------	-----------------	---------	-------	--------------	-----------

Mapping Union Types/Categories

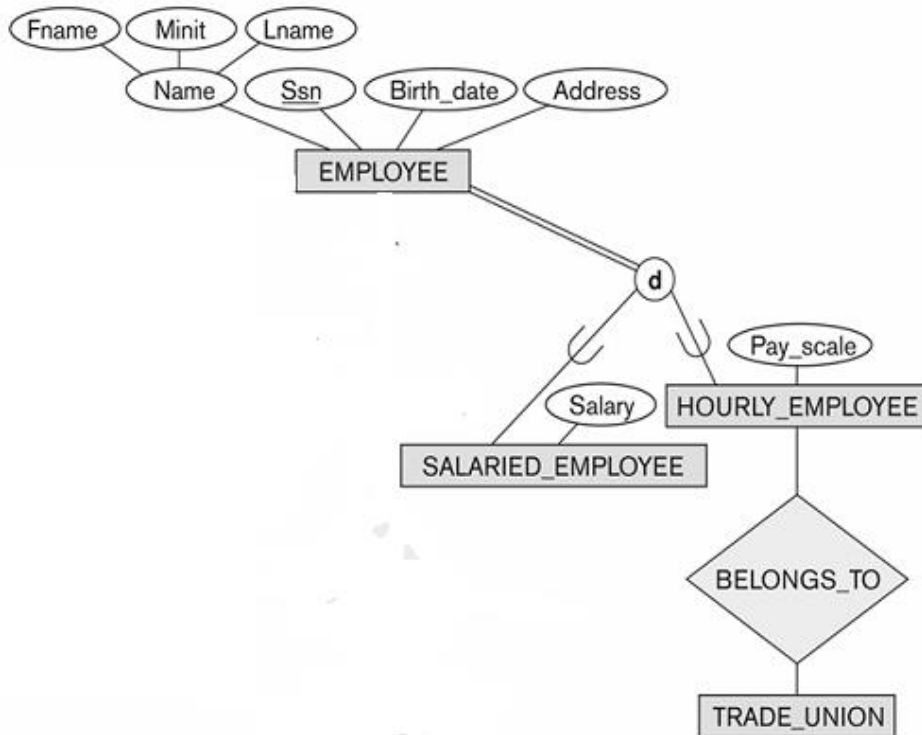

Steps:

For mapping a category whose defining superclass have different keys, it is customary to specify a new key attribute, called a surrogate key, when creating a relation to correspond to the category.

Let C_1, C_2, \dots, C_m be the entity types participating in the union and S be the union type. Create a relation for S and *surrogate key* k_s , so that $PK(S)=k_s$, and also add k_s to each $Attr(C_i)$ as a foreign key into S . If all the C_i s have the same primary key type, use that as $PK(S)$ instead.

So which option is better?

- Depends on applications; must consider tradeoff:
 - Too many relations (options 7A and 7B)
 - ◆ Inefficient query processing
 - Single relation (options 7C and 7D)
 - ◆ Lots of nulls; may “lose” some meaningful relationships

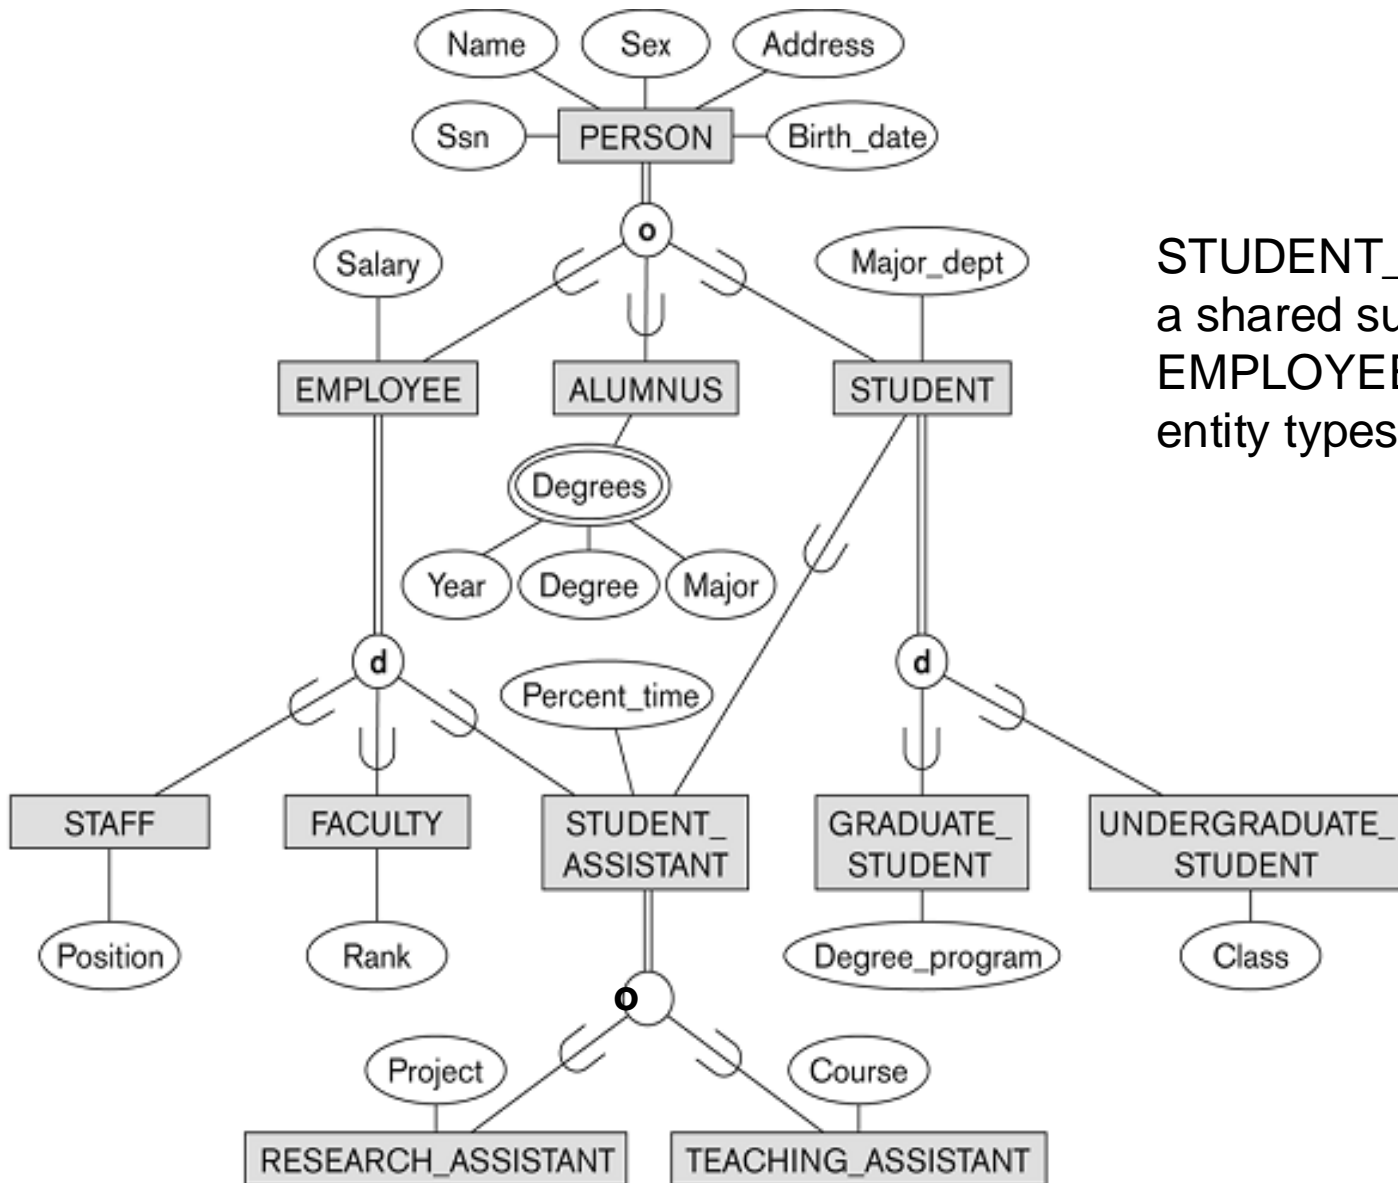

If everything is mapped to the Employee relation, we lose the relationship between hourly employee and trade union

EER to Relations Mapping

- Mapping of Shared Subclasses (Multiple Inheritance)
 - A shared subclass is a subclass of several superclasses, indicating multiple inheritance.
 - ◆ These superclasses must have the same key attribute
 - Can apply any of the four options (subject to their restrictions – total/partial, overlapping/disjoint)

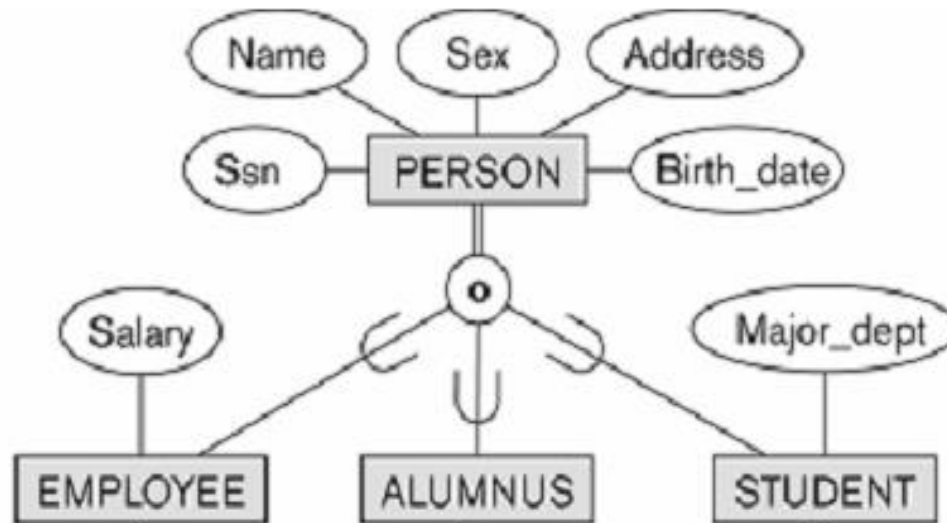

Example

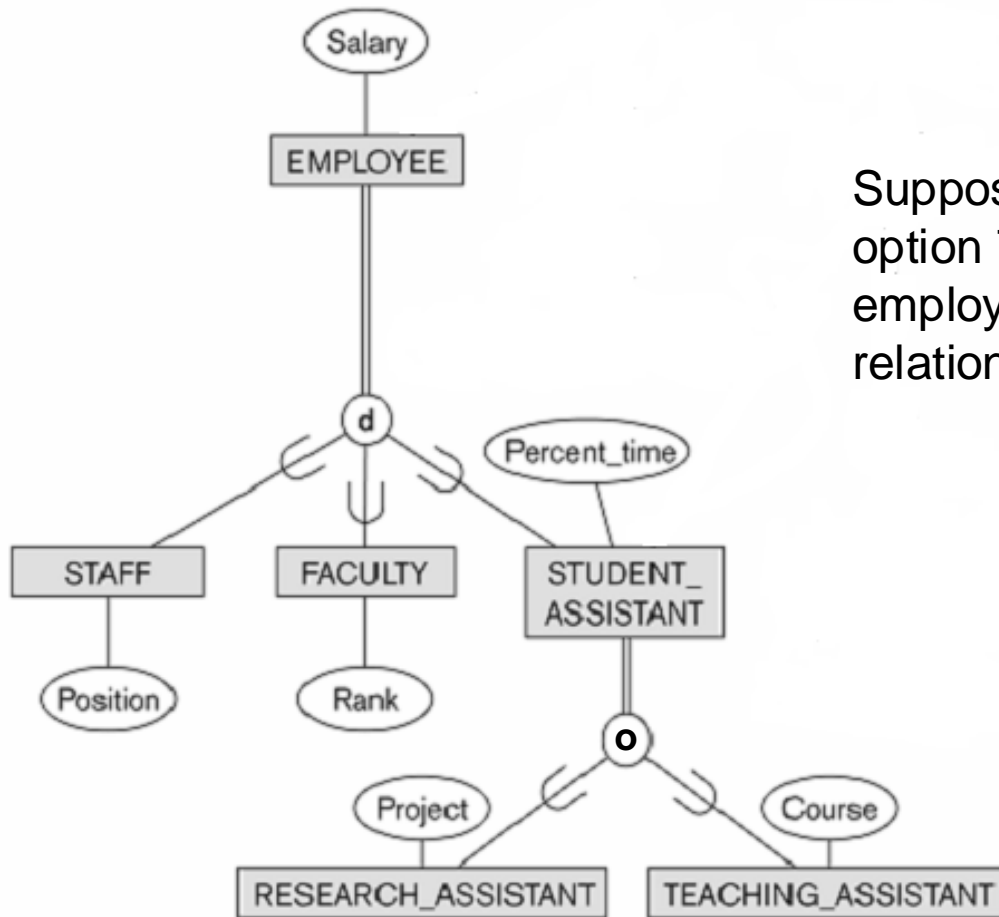

STUDENT_ASSISTANT is a shared subclass of the EMPLOYEE and STUDENT entity types

Example

- Since there are usually separate queries for employees, alumni, and students, we can use options 7A or 7B
 - Relations for option 7A: Person, Employee, Alumnus, Student
 - Relations for option 7B: Employee, Alumnus, Student

Example

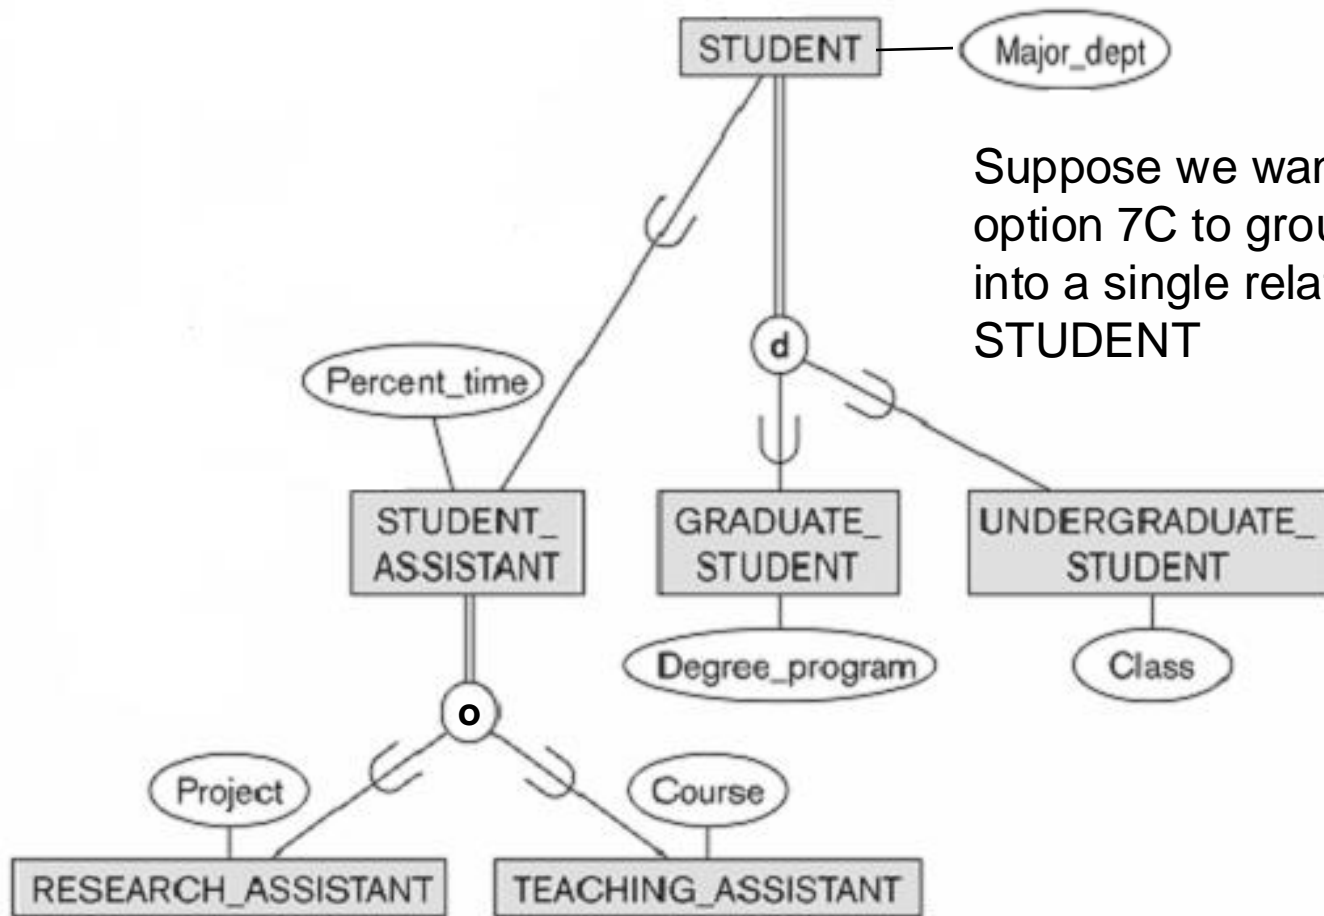

Suppose we want to use option 7C and 7D to group all employees into a single relation called EMPLOYEE

EMPLOYEE

<u>Ssn</u>	Salary	Employee_type	Position	Rank	Percent_time	Ra_flag	Ta_flag	Project	Course
------------	--------	---------------	----------	------	--------------	---------	---------	---------	--------

Example

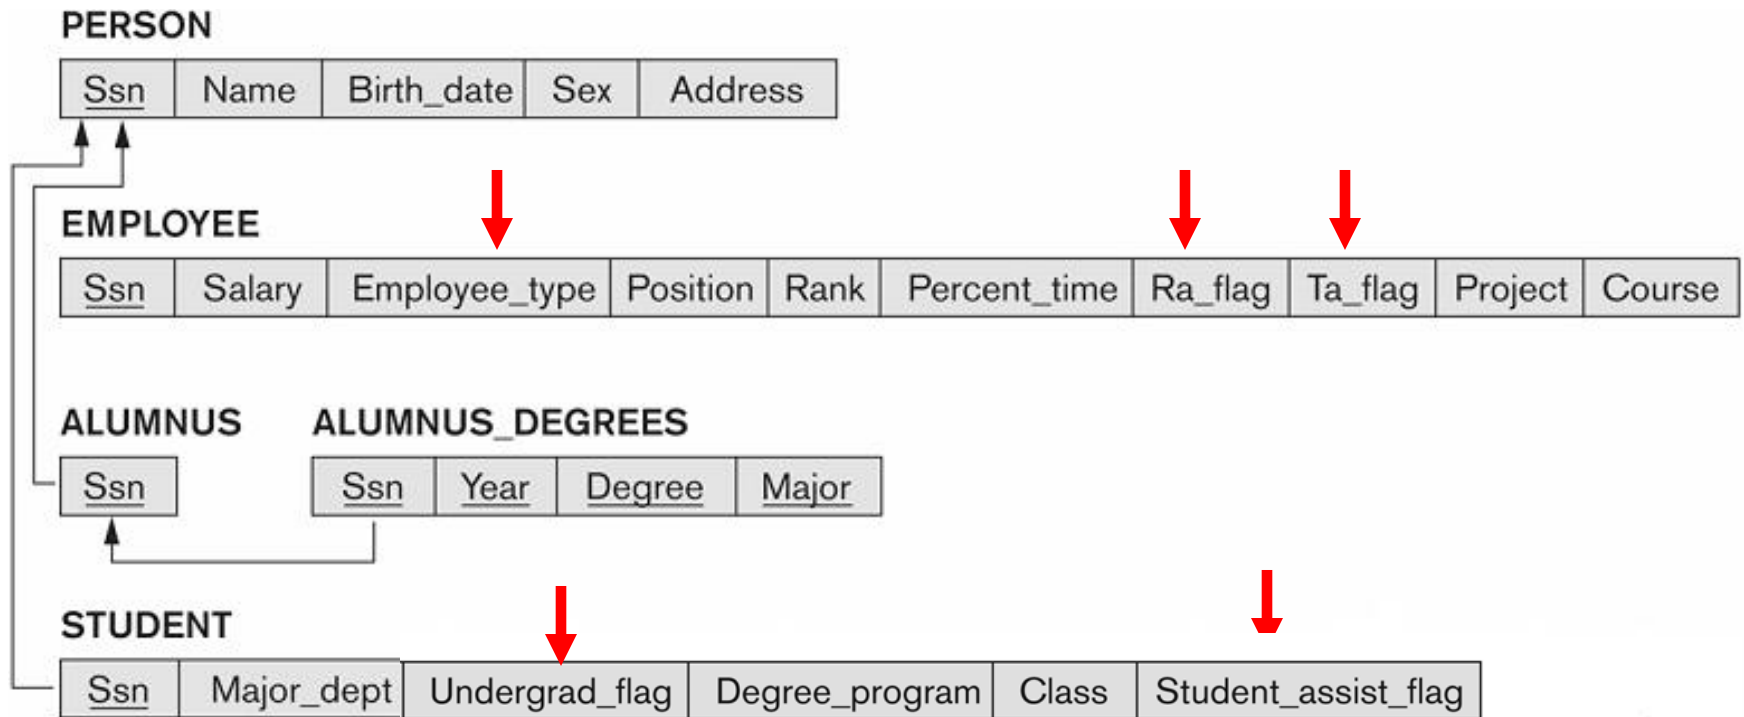

Suppose we want to use option 7C to group all students into a single relation called STUDENT

STUDENT

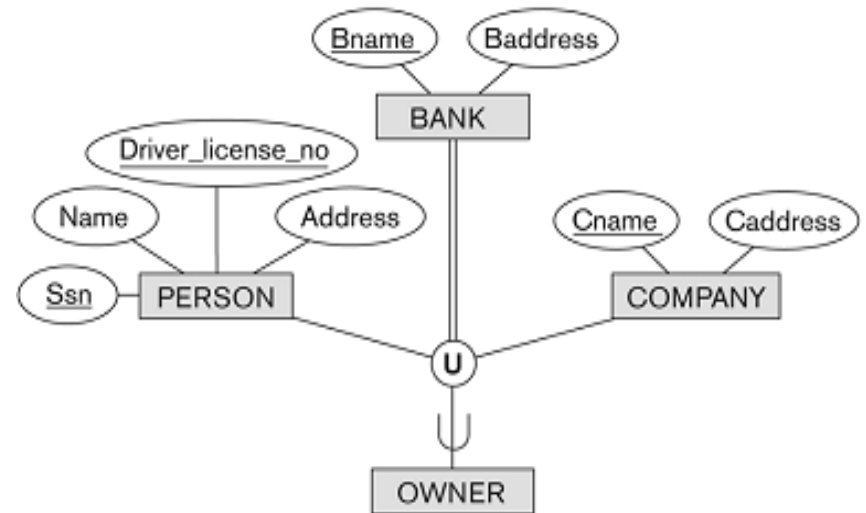

<u>Ssn</u>	Major_dept	Undergrad_flag	Degree_program	Class	Student_assist_flag
------------	------------	----------------	----------------	-------	---------------------

Putting it all together...

Union Types (Categories)

- Superclass can have several keys

- Add owner_type

**How to deal with
OWNER?**

PERSON

<u>Ssn</u>	Driver_license_no	Name	Address
------------	-------------------	------	---------

BANK

<u>Bname</u>	Baddress
--------------	----------

COMPANY

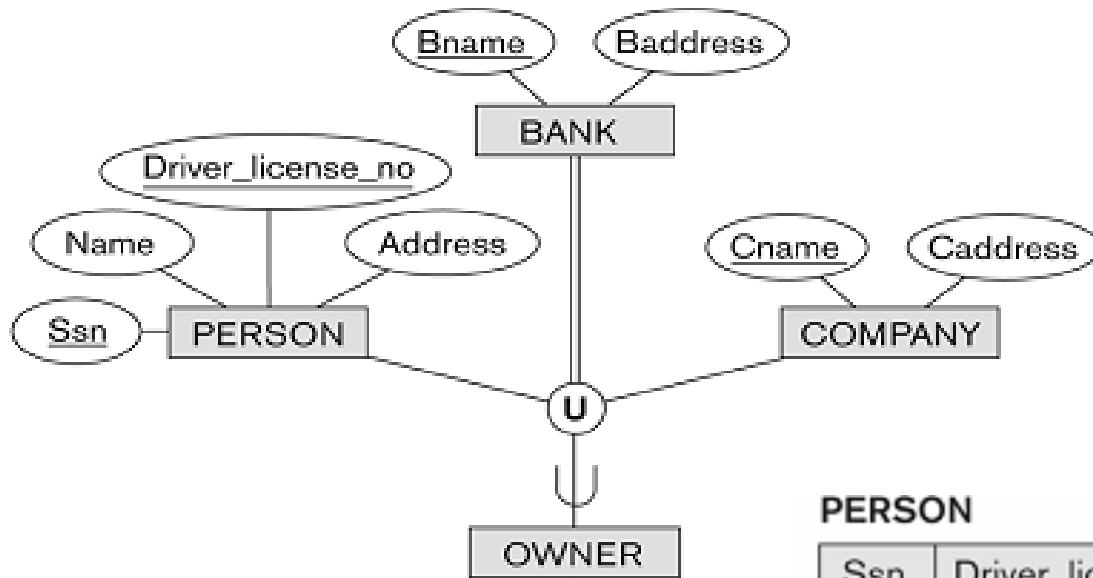

<u>Cname</u>	Caddress
--------------	----------

Mapping of Union Types (Categories)

- If all the superclasses have the same key
 - Include the key as an attribute of the category

- Otherwise
 - Create a new key attribute, called a **surrogate key**, as primary key of the category
 - Add surrogate key as foreign key for each superclass relation of the category
 - Add an attribute type to the category identifying particular entity type of the superclasses (PERSON, BANK, COMPANY)

Example (Owner Entity Type)

PERSON

<u>Ssn</u>	Driver_license_no	Name	Address	Owner_id
------------	-------------------	------	---------	----------

BANK

<u>Bname</u>	Baddress	Owner_id
--------------	----------	----------

COMPANY

<u>Cname</u>	Caddress	Owner_id
--------------	----------	----------

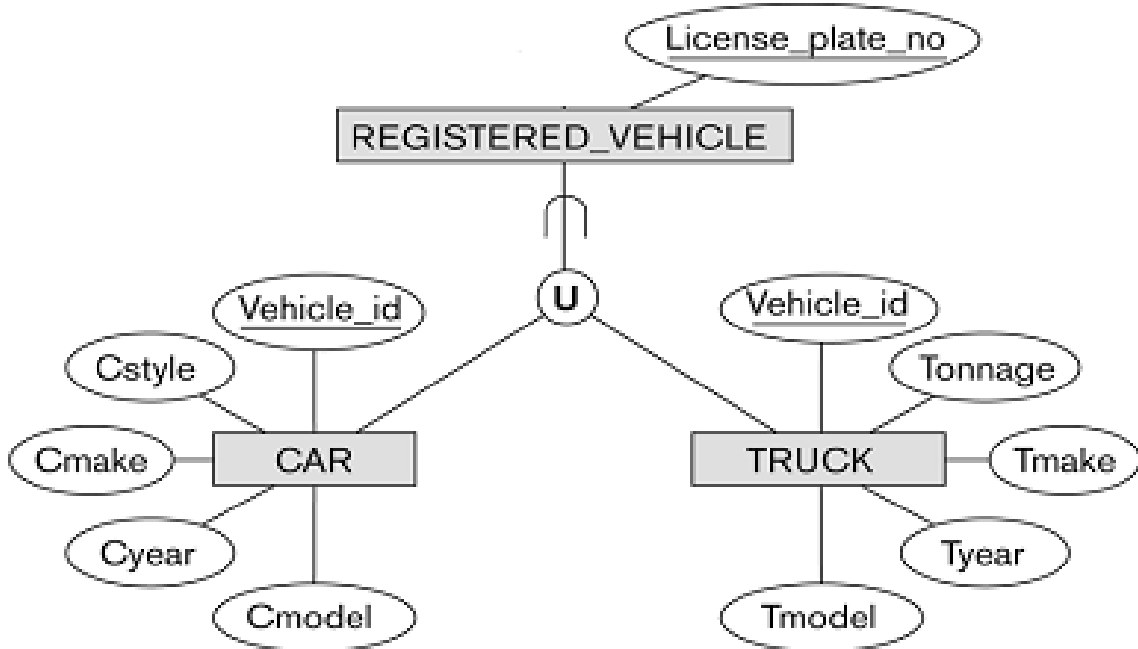

OWNER

<u>Owner_id</u>

Owner_id is
surrogate key

Example (Registered_Vehicle)

REGISTERED_VEHICLE

<u>Vehicle_id</u>	License_plate_number
-------------------	----------------------

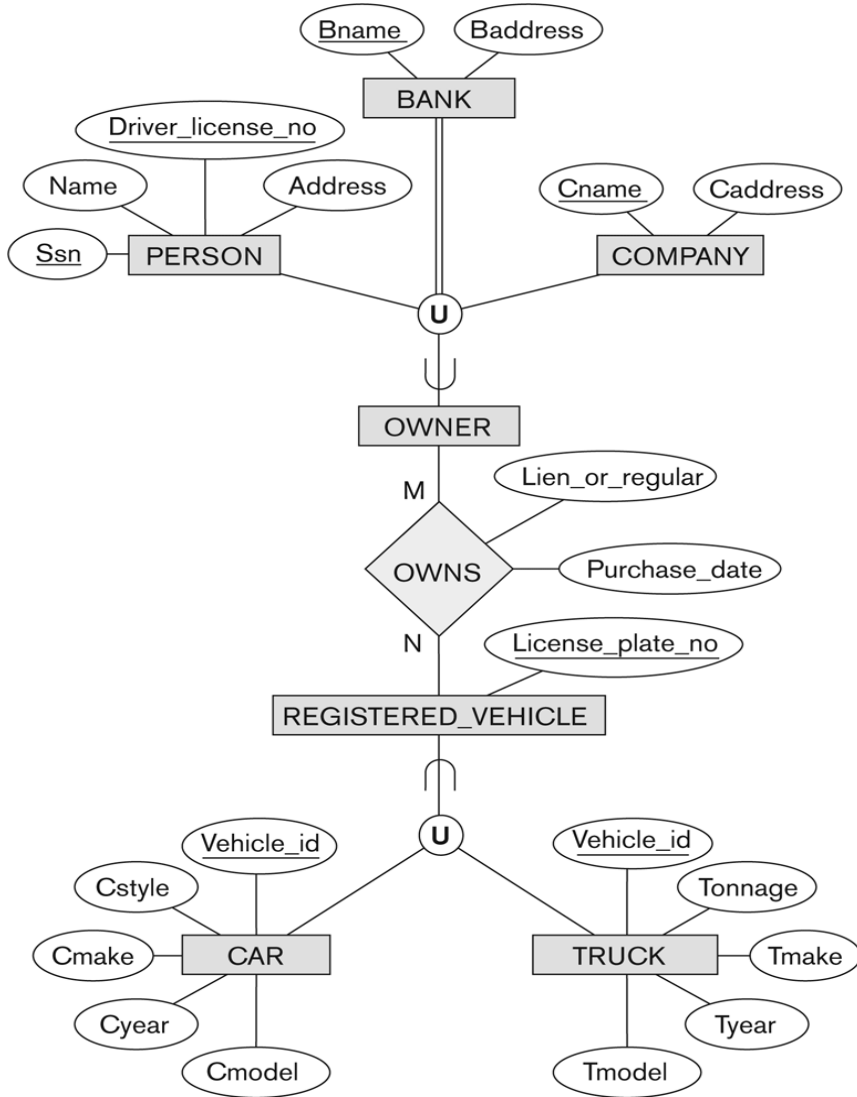

CAR

<u>Vehicle_id</u>	Cstyle	Cmake	Cmodel	Cyear
-------------------	--------	-------	--------	-------

TRUCK

<u>Vehicle_id</u>	Tmake	Tmodel	Tonnage	Tyear
-------------------	-------	--------	---------	-------

Example

PERSON

<u>Ssn</u>	Driver_license_no	Name	Address	Owner_id
------------	-------------------	------	---------	----------

BANK

<u>Bname</u>	Address	Owner_id
--------------	---------	----------

COMPANY

<u>Cname</u>	Address	Owner_id
--------------	---------	----------

OWNER

<u>Owner_id</u>

REGISTERED_VEHICLE

<u>Vehicle_id</u>	License_plate_number
-------------------	----------------------

CAR

<u>Vehicle_id</u>	Cstyle	Cmake	Cmodel	Cyear
-------------------	--------	-------	--------	-------

TRUCK

<u>Vehicle_id</u>	Tmake	Tmodel	Tonnage	Tyear
-------------------	-------	--------	---------	-------

OWNS

<u>Owner_id</u>	<u>Vehicle_id</u>	Purchase_date	Lien_or_regular
-----------------	-------------------	---------------	-----------------
